

**3.3V 600mA Low Dropout Regulator****Features**

- Dropout voltage typically 0.65V @ $I_o = 600\text{mA}$
- Output current in excess of 600mA
- Output voltage accuracy $\pm 2\%$
- Quiescent current, typically 0.3mA
- Internal short circuit current limit
- Internal over temperature protection

General Description

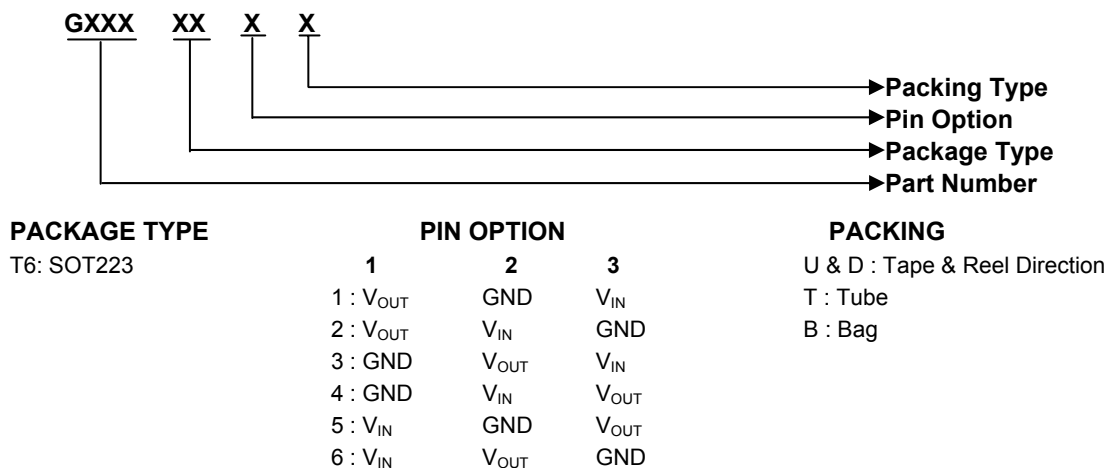

The G903 positive 3.3V voltage regulator features the ability to source 600mA of output current with a dropout voltage of typically 0.65V. A low quiescent current is provided. The typical quiescent current is 0.3mA.

Familiar regulator features such as over temperature and over current protection circuits are provided to prevent it from being damaged by abnormal operating conditions.

Ordering Information

SOT-223.....	27°C/W

Operating Conditions (Note 1)

Input Voltage.....	4V ~ 6.5V
Temperature Range.....	-40°C ≤ T _A ≤ 85°C

Note (1): See Recommended Minimum Footprint.

Electrical Characteristics

V_{IN} = 5V, I_O = 600mA, C_{IN} = 10μF, C_{OUT} = 10μF. All specifications apply for T_A = T_J = 25°C. [Note 3]

PARAMETER	CONDITION	MIN	TYP	MAX	UNIT
Output Voltage	10mA ≤ I _O ≤ 600mA	3.234	3.3	3.366	V
Line Regulation	4V ≤ V _{IN} ≤ 6V, I _O = 10mA	---	15	---	mV
Load Regulation	10mA ≤ I _O ≤ 600mA	---	20	---	mV
	10mA ≤ I _O ≤ 250mA	---	10	---	
Quiescent Current	V _{IN} = 5V	---	0.3	---	mA
Ripple Rejection	f _i = 120 Hz, 1V _{P-P} , I _O = 100mA	---	47	---	dB
Dropout Voltage	I _O = 600mA	---	0.65	---	V
	I _O = 250mA	---	0.25	---	
Output Current		---	600	---	mA
Short Circuit Current		---	0.65	---	A
Current Limit			0.8		A
Over Temperature		---	145	---	°C

Note 1: Absolute Maximum Ratings are limits beyond which damage to the device may occur. Operating Conditions are conditions under which the device functions but the specifications might not be guaranteed. For guaranteed specifications and test conditions see the Electrical Characteristics.

Note2: The maximum power dissipation is a function of the maximum junction temperature, T_{Jmax}; total thermal resistance, θ_{JA}, and ambient temperature T_A. The maximum allowable power dissipation at any ambient temperature is T_{Jmax} - T_A / θ_{JA}. If this dissipation is exceeded, the die temperature will rise above 150°C and IC will go into thermal shutdown. The θ_{JA} of SOT223 package is 147°C/W (See Recommended Minimum Footprint).

Note3: Low duty pulse techniques are used during test to maintain junction temperature as close to ambient as possible.

Note4: The type of output capacitor should be tantalum or aluminum.

Definitions**Dropout Voltage**

The input/output Voltage differential at which the regulator output no longer maintains regulation against further reductions in input voltage. Measured when the output drops 100mV below its nominal value, dropout voltage is affected by junction temperature, load current and minimum input supply requirements.

Line Regulation

The change in output voltage for a change in input voltage. The measurement is made under conditions of low dissipation or by using pulse techniques such that average chip temperature is not significantly affected.

Load Regulation

The change in output voltage for a change in load current at constant chip temperature. The measurement is made under conditions of low dissipation or by using pulse techniques such that average chip temperature is not significantly affected.

Maximum Power Dissipation

The maximum total device dissipation for which the regulator will operate within specifications.

Quiescent Bias Current

Current which is used to operate the regulator chip and is not delivered to the load.

Typical Performance Characteristics

($V_{IN}=+5V$, $C_{IN}=10\mu F$, $C_{OUT}=10\mu F$, $T_A=25^\circ C$, unless otherwise noted.)
